Motivation: Enumerating discrete structures...

Counting walks in \mathbb{N} with steps in $\{+1, -2\}$

$c_n := \#\{n \text{ steps walks starting at } 0 \text{ and ending at height } 0\}$

\updownarrow

$$G(t) := \sum_{n=0}^{\infty} c_n t^n$$

generating function

Motivation: Enumerating discrete structures...

Counting walks in \mathbb{N} with steps in $\{+1, -2\}$

$c_n := \#\{n \text{ steps walks starting at } 0 \text{ and ending at height } 0\}$

\updownarrow

$G(t) := \sum_{n=0}^{\infty} c_n t^n$ generating function

Enumeration refinement

$c_{n,d} := \#\{n \text{ steps walks starting at } 0 \text{ and ending at height } d\}$

\updownarrow

$F(t, u) := \sum_{n=0}^{\infty} \sum_{d=0}^n c_{n,d} u^d t^n$
complete generating function

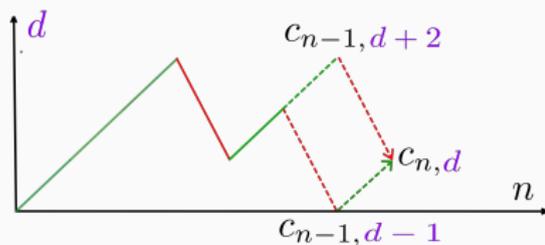

Motivation: Enumerating discrete structures...

Counting walks in \mathbb{N} with steps in $\{+1, -2\}$

$c_n := \#\{n \text{ steps walks starting at } 0 \text{ and ending at height } 0\}$

\updownarrow

$G(t) := \sum_{n=0}^{\infty} c_n t^n$ generating function

Enumeration refinement

$c_{n,d} := \#\{n \text{ steps walks starting at } 0 \text{ and ending at height } d\}$

\updownarrow

$F(t, u) := \sum_{n=0}^{\infty} \sum_{d=0}^n c_{n,d} u^d t^n$ complete generating function

DDE of order 2

$$c_{n,d} = c_{n-1,d-1} + c_{n-1,d+2}$$

\updownarrow

$$F(t, u) = 1 + t \cdot u \cdot F(t, u) + t \cdot \frac{F(t, u) - F(t, 0) - u \cdot \partial_u F(t, 0)}{u^2}$$

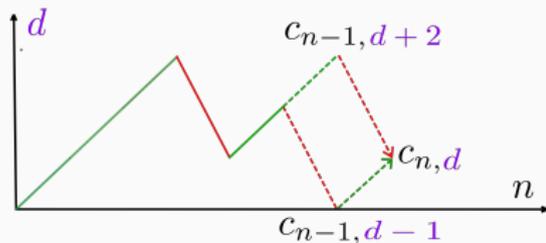

Motivation: Enumerating discrete structures...

Counting walks in \mathbb{N} with steps in $\{+1, -2\}$

$c_n := \#\{n \text{ steps walks starting at } 0 \text{ and ending at height } 0\}$

$$G(t) := \sum_{n=0}^{\infty} c_n t^n \quad \text{generating function}$$

Enumeration refinement

$c_{n,d} := \#\{n \text{ steps walks starting at } 0 \text{ and ending at height } d\}$

$$F(t, u) := \sum_{n=0}^{\infty} \sum_{d=0}^n c_{n,d} u^d t^n \quad \text{complete generating function}$$

DDE of order 2

$$c_{n,d} = c_{n-1,d-1} + c_{n-1,d+2}$$

$$F(t, u) = 1 + t \cdot u \cdot F(t, u) + t \cdot \frac{F(t, u) - F(t, 0) - u \cdot \partial_u F(t, 0)}{u^2}$$

$$c_{n,0} = c_n \implies F(t, 0) = G(t)$$

... yields **challenging** computational problems

\mathbb{K} effective field of characteristic 0.

$\mathbb{K} = \mathbb{Q}, \mathbb{Q}(y), \dots$

Starting point: $F \in \mathbb{K}[u][[t]]$, solution of the discrete differential equation of order **2**

$$F(t, u) = 1 + t \cdot u \cdot F(t, u) + t \cdot \Delta^{(2)} F(t, u),$$

where $\Delta F(t, u) := \frac{F(t, u) - F(t, 0)}{u}$ and $\Delta^{(2)} F(t, u) = \frac{F(t, u) - F(t, 0) - u \cdot \partial_u F(t, 0)}{u^2}$.

... yields **challenging** computational problems

\mathbb{K} effective field of characteristic 0.

$\mathbb{K} = \mathbb{Q}, \mathbb{Q}(y), \dots$

Starting point: $F \in \mathbb{K}[u][[t]]$, solution of the discrete differential equation of order **2**

$$F(t, u) = 1 + t \cdot u \cdot F(t, u) + t \cdot \Delta^{(2)} F(t, u),$$

where $\Delta F(t, u) := \frac{F(t, u) - F(t, 0)}{u}$ and $\Delta^{(2)} F(t, u) = \frac{F(t, u) - F(t, 0) - u \cdot \partial_u F(t, 0)}{u^2}$.

Interest: Nature of $F(t, 0)$.

... yields **challenging** computational problems

\mathbb{K} effective field of characteristic 0.

$\mathbb{K} = \mathbb{Q}, \mathbb{Q}(y), \dots$

Starting point: $F \in \mathbb{K}[u][[t]]$, solution of the discrete differential equation of order **2**

$$F(t, u) = 1 + t \cdot u \cdot F(t, u) + t \cdot \Delta^{(2)} F(t, u),$$

where $\Delta F(t, u) := \frac{F(t, u) - F(t, 0)}{u}$ and $\Delta^{(2)} F(t, u) = \frac{F(t, u) - F(t, 0) - u \cdot \partial_u F(t, 0)}{u^2}$.

Interest: Nature of $F(t, 0)$.

Classical: F , $F(t, 0)$ and $\partial_u F(t, 0)$ are **algebraic**. [Bousquet-Mélou, Jehanne '06]

... yields **challenging** computational problems

\mathbb{K} effective field of characteristic 0.

$\mathbb{K} = \mathbb{Q}, \mathbb{Q}(y), \dots$

Starting point: $F \in \mathbb{K}[u][[t]]$, solution of the discrete differential equation of order **2**

$$F(t, u) = 1 + t \cdot u \cdot F(t, u) + t \cdot \Delta^{(2)}F(t, u),$$

where $\Delta F(t, u) := \frac{F(t, u) - F(t, 0)}{u}$ and $\Delta^{(2)}F(t, u) = \frac{F(t, u) - F(t, 0) - u \cdot \partial_u F(t, 0)}{u^2}$.

Interest: Nature of $F(t, 0)$.

Classical: F , $F(t, 0)$ and $\partial_u F(t, 0)$ are **algebraic**. [Bousquet-Mélou, Jehanne '06]

Goals:

- Compute a polynomial $R \in \mathbb{K}[t, z_0] \setminus \{0\}$ such that $R(t, F(t, 0)) = 0$.
- Estimate the size of R for such DDEs.
- Complexity estimates (ops. in \mathbb{K}) for the computation of R .

Let $k \geq 1$, $f \in \mathbb{K}[u]$ and $Q \in \mathbb{K}[x, y_1, \dots, y_k, t, u]$. For $F \in \mathbb{K}[u][[t]]$, define $\Delta(F) := (F - F(t, 0))/u \in \mathbb{K}[u][[t]]$ and $\Delta^{(i)}(F) := \Delta \circ \Delta^{(i-1)}(F)$.

Theorem [Bousquet-Mélou, Jehanne '06]

There exists a unique solution $F \in \mathbb{K}[u][[t]]$ to

$$F(t, u) = f(u) + t \cdot Q(F, \Delta(F), \dots, \Delta^{(k)}(F), t, u), \quad (\text{DDE})$$

and moreover $F(t, u)$ is **algebraic** over $\mathbb{K}(t, u)$.

Let $k \geq 1$, $f \in \mathbb{K}[u]$ and $Q \in \mathbb{K}[x, y_1, \dots, y_k, t, u]$. For $F \in \mathbb{K}[u][[t]]$, define $\Delta(F) := (F - F(t, 0))/u \in \mathbb{K}[u][[t]]$ and $\Delta^{(i)}(F) := \Delta \circ \Delta^{(i-1)}(F)$.

Theorem [Bousquet-Mélou, Jehanne '06]

There exists a unique solution $F \in \mathbb{K}[u][[t]]$ to

$$F(t, u) = f(u) + t \cdot Q(F, \Delta(F), \dots, \Delta^{(k)}(F), t, u), \quad (\text{DDE})$$

and moreover $F(t, u)$ is **algebraic** over $\mathbb{K}(t, u)$.

$$F(t, u) = f(u) + t \cdot Q(F, \Delta(F), \dots, \Delta^{(k)}(F), t, u), \quad (\text{DDE})$$

where $\Delta(F) := \frac{F(t, u) - F(t, 0)}{u}$.

Input: $P := \text{numerator}(\text{DDE})$,
Goal: Compute $R \in \mathbb{K}[t, z_0] \setminus \{0\}$ s.t. $R(t, F(t, 0)) = 0$.

1. **Geometric analysis** of Bousquet-Mélou and Jehanne's algorithm yielding:
 - Theoretical estimate for the degree of $R \in \mathbb{K}[t, z_0]$ s.t. $R(t, F(t, 0)) = 0$,
 - Arithmetic complexity.
2. **New algorithm** based on **algebraic elimination** + Gröbner bases,
3. **Implementations** yielding practical improvements.

Example: (walks in \mathbb{N} with steps in $\{+1, -2\}$)

We consider $P(F(t, u), F(t, 0), \partial_u F(t, 0), t, u) = 0$

$$u^2 - (u^2 - t(1 + u^3)) \cdot F(t, u) - t \cdot F(t, 0) - t \cdot u \cdot \partial_u F(t, 0) = 0$$

Example: (walks in \mathbb{N} with steps in $\{+1, -2\}$)

We consider $P(F(t, u), F(t, 0), \partial_u F(t, 0), t, u) = 0$

$$u^2 - (u^2 - t(1 + u^3)) \cdot F(t, u) - t \cdot F(t, 0) - t \cdot u \cdot \partial_u F(t, 0) = 0$$

Study the solutions of $\partial_1 P(F(t, u), F(t, 0), \partial_u F(t, 0), t, u) = 0$

$$u^2 = t(1 + u^3) \implies u = U_1(t), U_2(t) \in \{\sqrt{t} + O(t), -\sqrt{t} + O(t)\}$$

Example: (walks in \mathbb{N} with steps in $\{+1, -2\}$)

We consider $P(F(t, u), F(t, 0), \partial_u F(t, 0), t, u) = 0$

$$u^2 - (u^2 - t(1 + u^3)) \cdot F(t, u) - t \cdot F(t, 0) - t \cdot u \cdot \partial_u F(t, 0) = 0$$

Study the solutions of $\partial_1 P(F(t, u), F(t, 0), \partial_u F(t, 0), t, u) = 0$

$$u^2 = t(1 + u^3) \implies u = U_1(t), U_2(t) \in \{\sqrt{t} + O(t), -\sqrt{t} + O(t)\}$$

Hence $(x_1, u_1, x_2, u_2) = (F(t, U_1), U_1, F(t, U_2), U_2)$ is a solution of the constraints \mathcal{T}

$$\mathcal{T}: \quad \text{For } 1 \leq i \leq 2, \quad \begin{cases} P(x_i, F(t, 0), \partial_u F(t, 0), t, u_i) = 0, \\ \partial_1 P(x_i, F(t, 0), \partial_u F(t, 0), t, u_i) = 0, \\ \partial_u P(x_i, F(t, 0), \partial_u F(t, 0), t, u_i) = 0. \end{cases} \quad m \cdot (u_1 - u_2) = 1,$$

Example: (walks in \mathbb{N} with steps in $\{+1, -2\}$)

We consider $P(F(t, u), F(t, 0), \partial_u F(t, 0), t, u) = 0$

$$u^2 - (u^2 - t(1 + u^3)) \cdot F(t, u) - t \cdot F(t, 0) - t \cdot u \cdot \partial_u F(t, 0) = 0$$

Study the solutions of $\partial_1 P(F(t, u), F(t, 0), \partial_u F(t, 0), t, u) = 0$

$$u^2 = t(1 + u^3) \implies u = U_1(t), U_2(t) \in \{\sqrt{t} + O(t), -\sqrt{t} + O(t)\}$$

Hence $(x_1, u_1, x_2, u_2) = (F(t, U_1), U_1, F(t, U_2), U_2)$ is a solution of the constraints \mathcal{T}

$$\mathcal{T}: \quad \text{For } 1 \leq i \leq 2, \quad \begin{cases} P(x_i, F(t, 0), \partial_u F(t, 0), t, u_i) = 0, \\ \partial_1 P(x_i, F(t, 0), \partial_u F(t, 0), t, u_i) = 0, \\ \partial_u P(x_i, F(t, 0), \partial_u F(t, 0), t, u_i) = 0. \end{cases} \quad m \cdot (u_1 - u_2) = 1,$$

Permuting (x_1, u_1) and (x_2, u_2) does not change the solution set
 $\implies \mathfrak{S}_2$ acts on $V(\mathcal{T})$ and preserves the $\{z_0, z_1, t\}$ -coordinate space.

Example: (walks in \mathbb{N} with steps in $\{+1, -2\}$)

We consider $P(F(t, u), F(t, 0), \partial_u F(t, 0), t, u) = 0$

$$u^2 - (u^2 - t(1 + u^3)) \cdot F(t, u) - t \cdot F(t, 0) - t \cdot u \cdot \partial_u F(t, 0) = 0$$

Study the solutions of $\partial_1 P(F(t, u), F(t, 0), \partial_u F(t, 0), t, u) = 0$

$$u^2 = t(1 + u^3) \implies u = U_1(t), U_2(t) \in \{\sqrt{t} + O(t), -\sqrt{t} + O(t)\}$$

Hence $(x_1, u_1, x_2, u_2) = (F(t, U_1), U_1, F(t, U_2), U_2)$ is a solution of the constraints \mathcal{T}

$$\mathcal{T}: \quad \text{For } 1 \leq i \leq 2, \quad \begin{cases} P(x_i, F(t, 0), \partial_u F(t, 0), t, u_i) = 0, \\ \partial_1 P(x_i, F(t, 0), \partial_u F(t, 0), t, u_i) = 0, \\ \partial_u P(x_i, F(t, 0), \partial_u F(t, 0), t, u_i) = 0. \end{cases} \quad m \cdot (u_1 - u_2) = 1,$$

Permuting (x_1, u_1) and (x_2, u_2) does not change the solution set
 $\implies \mathfrak{S}_2$ acts on $V(\mathcal{T})$ and preserves the $\{z_0, z_1, t\}$ -coordinate space.

Impact of this group action?

Denote by \mathcal{I} the ideal generated by the k duplications of $(P, \partial_1 P, \partial_u P)$ and $m \cdot \prod_{i \neq j} (u_i - u_j) - 1 = 0$.

Assume that:

- there exist k distinct solutions $u = U_1, \dots, U_k \in \overline{\mathbb{K}}[[t^{\frac{1}{*}}]]$ of $\partial_1 P(u) = 0$,
- \mathcal{I} is radical and of dimension 0 over $\mathbb{K}(t)$. (3k equations and 3k unknowns)

Denote by \mathcal{I} the ideal generated by the k duplications of $(P, \partial_1 P, \partial_u P)$ and $m \cdot \prod_{i \neq j} (u_i - u_j) - 1 = 0$.

Assume that:

- there exist k distinct solutions $u = U_1, \dots, U_k \in \overline{\mathbb{K}}[[t^{\frac{1}{k}}]]$ of $\partial_1 P(u) = 0$,
- \mathcal{I} is radical and of dimension 0 over $\mathbb{K}(t)$. (3k equations and 3k unknowns)

Theorem [Bostan, N., Safey El Din '23]

- Let $\delta := \deg(P)$. There exists a nonzero polynomial $R \in \mathbb{K}[t, z_0]$ whose partial degrees are bounded by $\delta^k(\delta - 1)^{2k}/k!$ and such that $R(t, F(t, 0)) = 0$.
- There exists an algorithm computing R in $\tilde{O}(\delta^{6k}(k^2\delta^{k+3} + \delta^{1.89k}/k!))$ ops. in \mathbb{K} .

Ideas of the proof:

→ Bézout bound + \mathfrak{S}_k acts on $V(\mathcal{I}_{\text{dup}})$ and preserves the z_0 -coordinate space.

→ Parametric geometric resolution [Schost '03], [Giusti, Lecerf, Salvy '01]

$$z_0 = V(t, \lambda) / \partial_\lambda W(t, \lambda), W(t, \lambda) = 0$$

→ Change of monomial ordering:

Stickelberger's theorem [Cox '21]

$$R = \text{Sqfree}(\text{Res}_\lambda(z_0 \cdot \partial_\lambda W - V, W))$$

+ bivariate resultants [Villard '18], [van der Hoeven, Lecerf '21]

Summary of the initial problem: $\underline{z} \equiv z_0, \dots, z_{k-1}; P = \text{"numer"}(DDE) \in \mathbb{K}(t)[x, \mathbf{u}, \underline{z}]$

There exist k solutions $(x, \mathbf{u}) \in \overline{\mathbb{K}(t)}^2$ with **distinct** \mathbf{u} -coordinates to

$$\begin{cases} P(x, \mathbf{u}, F(t, 0), \dots, \partial_u^{k-1} F(t, 0)) = 0, \\ \partial_1 P(x, \mathbf{u}, F(t, 0), \dots, \partial_u^{k-1} F(t, 0)) = 0, \quad \mathbf{u} \neq 0, \\ \partial_u P(x, \mathbf{u}, F(t, 0), \dots, \partial_u^{k-1} F(t, 0)) = 0. \end{cases}$$

Summary of the initial problem: $\underline{z} \equiv z_0, \dots, z_{k-1}; P = \text{"numer"}(DDE) \in \mathbb{K}(t)[x, \mathbf{u}, \underline{z}]$

There exist k solutions $(x, \mathbf{u}) \in \overline{\mathbb{K}(t)}^2$ with **distinct** \mathbf{u} -coordinates to

$$\begin{cases} P(x, \mathbf{u}, F(t, 0), \dots, \partial_u^{k-1} F(t, 0)) = 0, \\ \partial_1 P(x, \mathbf{u}, F(t, 0), \dots, \partial_u^{k-1} F(t, 0)) = 0, & \mathbf{u} \neq 0, \\ \partial_u P(x, \mathbf{u}, F(t, 0), \dots, \partial_u^{k-1} F(t, 0)) = 0. \end{cases}$$

Define

$$\pi_x : (x, \mathbf{u}, \underline{z}) \in \overline{\mathbb{K}(t)}^{k+2} \mapsto (\mathbf{u}, \underline{z}) \in \overline{\mathbb{K}(t)}^{k+1},$$

$$\pi_u : (\mathbf{u}, \underline{z}) \in \overline{\mathbb{K}(t)}^{k+1} \mapsto (\underline{z}) \in \overline{\mathbb{K}(t)}^k,$$

and consider $\mathbf{W} := \pi_x(V(P, \partial_1 P, \partial_u P) \setminus V(\mathbf{u}))$.

Summary of the initial problem: $\underline{z} \equiv z_0, \dots, z_{k-1}; P = \text{"numer"}(DDE) \in \mathbb{K}(t)[x, \mathbf{u}, \underline{z}]$

There exist k solutions $(x, \mathbf{u}) \in \overline{\mathbb{K}(t)}^2$ with **distinct** \mathbf{u} -coordinates to

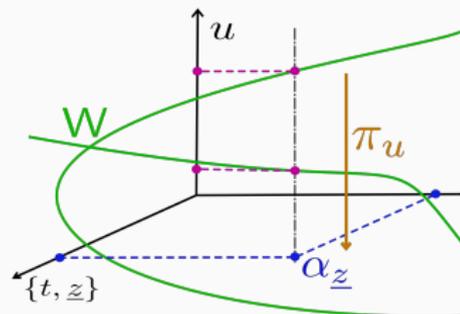

$$\begin{cases} P(x, \mathbf{u}, F(t, 0), \dots, \partial_u^{k-1} F(t, 0)) = 0, \\ \partial_1 P(x, \mathbf{u}, F(t, 0), \dots, \partial_u^{k-1} F(t, 0)) = 0, & \mathbf{u} \neq 0, \\ \partial_u P(x, \mathbf{u}, F(t, 0), \dots, \partial_u^{k-1} F(t, 0)) = 0. \end{cases}$$

Define

$$\pi_x : (x, \mathbf{u}, \underline{z}) \in \overline{\mathbb{K}(t)}^{k+2} \mapsto (\mathbf{u}, \underline{z}) \in \overline{\mathbb{K}(t)}^{k+1},$$

$$\pi_u : (\mathbf{u}, \underline{z}) \in \overline{\mathbb{K}(t)}^{k+1} \mapsto (\underline{z}) \in \overline{\mathbb{K}(t)}^k,$$

and consider $\mathbf{W} := \pi_x(V(P, \partial_1 P, \partial_u P) \setminus V(\mathbf{u}))$.

$$\# \pi_u^{-1}(\alpha_z) \cap \mathbf{W} = 2$$

Summary of the initial problem: $\underline{z} \equiv z_0, \dots, z_{k-1}; P = \text{"numer"}(DDE) \in \mathbb{K}(t)[x, \mathbf{u}, \underline{z}]$

There exist k solutions $(x, \mathbf{u}) \in \overline{\mathbb{K}(t)}^2$ with **distinct** \mathbf{u} -coordinates to

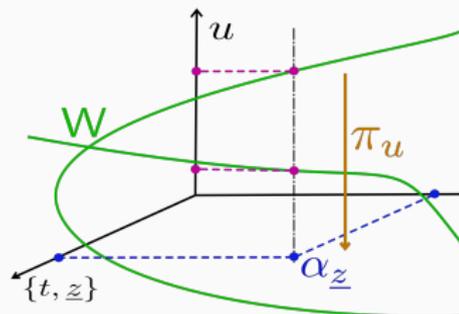

$$\begin{cases} P(x, \mathbf{u}, F(t, 0), \dots, \partial_u^{k-1} F(t, 0)) = 0, \\ \partial_1 P(x, \mathbf{u}, F(t, 0), \dots, \partial_u^{k-1} F(t, 0)) = 0, \quad \mathbf{u} \neq 0, \\ \partial_u P(x, \mathbf{u}, F(t, 0), \dots, \partial_u^{k-1} F(t, 0)) = 0. \end{cases}$$

Define

$$\pi_x : (x, \mathbf{u}, \underline{z}) \in \overline{\mathbb{K}(t)}^{k+2} \mapsto (\mathbf{u}, \underline{z}) \in \overline{\mathbb{K}(t)}^{k+1},$$

$$\pi_u : (\mathbf{u}, \underline{z}) \in \overline{\mathbb{K}(t)}^{k+1} \mapsto (\underline{z}) \in \overline{\mathbb{K}(t)}^k,$$

and consider $\mathbf{W} := \pi_x(V(P, \partial_1 P, \partial_u P) \setminus V(\mathbf{u}))$.

$$\# \pi_u^{-1}(\alpha_z) \cap \mathbf{W} = 2$$

Objective:

Characterize with polynomial constraints

$$\mathcal{F}_k := \{\alpha_z \in \overline{\mathbb{K}(t)}^k \mid \# \pi_u^{-1}(\alpha_z) \cap \mathbf{W} \geq k\}$$

Example: (Walks in \mathbb{N} with steps in $\{+1, -2\}$)

$$P := (1 - x)u^2 + tu^3x + t(x - z_0 - uz_1) \in \mathbb{K}(t)[x, u, z_0, z_1], \quad k = 2.$$

G_u Gröbner basis of $\langle P, \partial_1 P, \partial_u P, mu - 1 \rangle \cap \mathbb{K}[u, t, z_0, z_1]$ for $\{u\} \succ_{lex} \{t, z_0, z_1\}$:

Example: (Walks in \mathbb{N} with steps in $\{+1, -2\}$)

$$P := (1 - x)u^2 + tu^3x + t(x - z_0 - uz_1) \in \mathbb{K}(t)[x, u, z_0, z_1], \quad k = 2.$$

G_u Gröbner basis of $\langle P, \partial_1 P, \partial_u P, mu - 1 \rangle \cap \mathbb{K}[u, t, z_0, z_1]$ for $\{u\} \succ_{lex} \{t, z_0, z_1\}$:

$$\begin{array}{l} B_0 : \quad \quad \quad \gamma_0 \\ B_1 : \left\{ \begin{array}{l} \beta_1 \cdot u + \gamma_1 \\ \vdots \\ \beta_r \cdot u + \gamma_r \end{array} \right. , \gamma_i, \beta_j \in \mathbb{K}[t, z_0, z_1] \\ B_2 : \quad g_2 := u^2 + \beta_{r+1} \cdot u + \gamma_{r+1} \end{array}$$

“At (z_0, z_1) fixed in $\overline{\mathbb{K}(t)}^2$,
there exist two **distinct** roots in u ”

Example: (Walks in \mathbb{N} with steps in $\{+1, -2\}$)

$$P := (1-x)u^2 + tu^3x + t(x - z_0 - uz_1) \in \mathbb{K}(t)[x, u, z_0, z_1], \quad k = 2.$$

G_u Gröbner basis of $\langle P, \partial_1 P, \partial_u P, mu - 1 \rangle \cap \mathbb{K}[u, t, z_0, z_1]$ for $\{u\} \succ_{lex} \{t, z_0, z_1\}$:

$$\begin{aligned} B_0 : & \quad \gamma_0 \\ B_1 : & \left\{ \begin{array}{l} \beta_1 \cdot u + \gamma_1 \\ \vdots \\ \beta_r \cdot u + \gamma_r \end{array} \right. , \gamma_i, \beta_j \in \mathbb{K}[t, z_0, z_1] \\ B_2 : & \quad g_2 := u^2 + \beta_{r+1} \cdot u + \gamma_{r+1} \end{aligned}$$

“At (z_0, z_1) fixed in $\overline{\mathbb{K}(t)}^2$,
there exist two **distinct** roots in u ”

Necessary condition:

At $\alpha \in V(G_u \cap \mathbb{K}[t, z_0, z_1])$ fixed,
there exist two roots in u

$$\implies \beta_i, \gamma_j = 0 \quad (\text{equations})$$

Example: (Walks in \mathbb{N} with steps in $\{+1, -2\}$)

$$P := (1-x)u^2 + tu^3x + t(x - z_0 - uz_1) \in \mathbb{K}(t)[x, u, z_0, z_1], \quad k = 2.$$

G_u Gröbner basis of $\langle P, \partial_1 P, \partial_u P, mu - 1 \rangle \cap \mathbb{K}[u, t, z_0, z_1]$ for $\{u\} \succ_{lex} \{t, z_0, z_1\}$:

$$\begin{array}{l}
 B_0 : \quad \gamma_0 \\
 B_1 : \left\{ \begin{array}{l} \beta_1 \cdot u + \gamma_1 \\ \vdots \\ \beta_r \cdot u + \gamma_r \end{array} \right. , \gamma_i, \beta_j \in \mathbb{K}[t, z_0, z_1] \\
 B_2 : \quad g_2 := u^2 + \beta_{r+1} \cdot u + \gamma_{r+1}
 \end{array}$$

“At (z_0, z_1) fixed in $\overline{\mathbb{K}(t)}^2$,
there exist two **distinct** roots in u ”

Necessary condition:

At $\alpha \in V(G_u \cap \mathbb{K}[t, z_0, z_1])$ fixed,
there exist two roots in u
 $\implies \beta_i, \gamma_j = 0$ (equations)

Extension theorem:

The **pre-image** of α by π_u is well-defined
 $\implies \text{LeadingCoeff}_u(g_2) \neq 0$
Distinct roots in $u \implies \text{disc}_u(g_2) \neq 0$ (inequations)

Example: (Walks in \mathbb{N} with steps in $\{+1, -2\}$)

$$P := (1-x)u^2 + tu^3x + t(x - z_0 - uz_1) \in \mathbb{K}(t)[x, u, z_0, z_1], \quad k = 2.$$

G_u Gröbner basis of $\langle P, \partial_1 P, \partial_u P, mu - 1 \rangle \cap \mathbb{K}[u, t, z_0, z_1]$ for $\{u\} \succ_{lex} \{t, z_0, z_1\}$:

$$\begin{array}{l} B_0 : \quad \quad \quad \gamma_0 \\ B_1 : \left\{ \begin{array}{l} \beta_1 \cdot u + \gamma_1 \\ \vdots \\ \beta_r \cdot u + \gamma_r \end{array} \right. , \gamma_i, \beta_j \in \mathbb{K}[t, z_0, z_1] \\ B_2 : \quad g_2 := u^2 + \beta_{r+1} \cdot u + \gamma_{r+1} \end{array} \quad \text{"At } (z_0, z_1) \text{ fixed in } \overline{\mathbb{K}(t)}^2, \\ \text{there exist two distinct roots in } u \text{"}$$

Necessary condition:

At $\alpha \in V(G_u \cap \mathbb{K}[t, z_0, z_1])$ fixed,
there exist two roots in u
 $\implies \beta_i, \gamma_j = 0$ (equations)

Extension theorem:

The pre-image of α by π_u is well-defined
 $\implies \text{LeadingCoeff}_u(g_2) \neq 0$
Distinct roots in $u \implies \text{disc}_u(g_2) \neq 0$ (inequations)

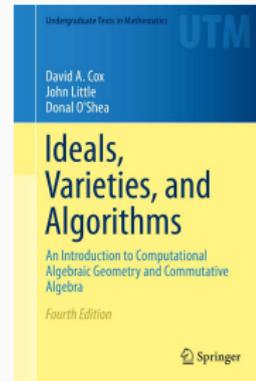

After adding these constraints to G_u and eliminating u and z_1 :

$$R(t, z_0) = t^3 z_0^3 - z_0 + 1 \text{ satisfies } R(t, F(t, 0)) = 0$$

- **Projecting:** Elimination theorem
- **Lifting points of the projections:** Extension theorems

Cardinality conditions on the fibers:

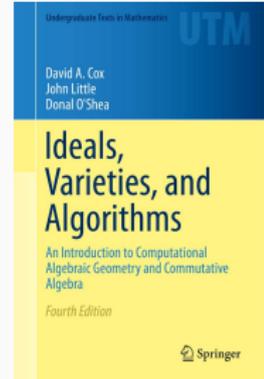

- **Extension theorem** (Gröbner bases version)
- $g(u, \alpha_{\underline{z}}) \in \overline{\mathbb{K}(t)}[u]$ of degree $k + j$ has at least k distinct roots
 \iff One of the $(k \times k)$ -minors of the **Hermite quadratic form** associated with g does not vanish at $\alpha_{\underline{z}}$

- **Projecting: Elimination theorem**
- **Lifting points of the projections: Extension theorems**

Cardinality conditions on the fibers:

- **Extension theorem** (Gröbner bases version)
- $g(u, \alpha_{\underline{z}}) \in \overline{\mathbb{K}(t)}[u]$ of degree $k + j$ has at least k distinct roots
 \iff One of the $(k \times k)$ -minors of the **Hermite quadratic form** associated with g does not vanish at $\alpha_{\underline{z}}$

[Bostan, N., Safey El Din '23] :

Conjunctions of **polynomial equations** and **inequations** whose zero set is \mathcal{F}_k

3-Tamari, $k = 3$

A	T	d_t	d_{z_0}

- **A**: Algorithm used (D: duplication, DE: direct elimination, HGP: Hybrid Guess-and-Prove [Bostan, Chyzak, N., Safey El Din '22]),
- **T**: total timing needed to obtain an output in $\mathbb{Q}[t, z_0]$,
- **d_z** : degree in $Z \in \{t, z_0\}$ of output $R \in \mathbb{Q}[t, z_0]$ s.t. $R(t, F(t, a)) = 0$,

Intel® Xeon® Gold CPU 6246R v4 @ 3.40GHz and 1.5TB of RAM with a single thread.

Gröbner bases computations are performed using the C library `msolve`, and all guessing computations are performed using the `gfun` Maple package.

Conclusion

- **New geometric interpretations** of the problem “solving a DDE”,
- **New algorithm** based on algebraic elimination and Gröbner bases,
- Some **promising** practical results,
- (In the preprint) **New geometric algorithm** based on Stickelberger's theorem.

Future works

- Study the *minimality* and the *genericity* of the introduced assumptions,
- **Provide a maple package** for solving DDEs, together with a **tutorial paper**.

 $R(t, F_0) = O(t^{\sim b_t b_z})$

(6) Certify that $R(t, F_0) = 0$

tools

- Newton iteration

- Algebraic approximants
"seriestoalgeq"

- Multiplicity lemma:
 $R(t, F_0) = O(t^{\sim 2b_t b_z})$
implies $R(t, F_0) = 0$

Counting walks in \mathbb{N} with steps in $\{+1, -2\}$

$$F(t, u) = 1 + t \cdot u \cdot F(t, u) + t \cdot \frac{F(t, u) - F(t, 0) - u \cdot \partial_u F(t, 0)}{u^2}$$

- Draw a random $c = 1341$, and a prime number $p = 19541$,
- Using the **new algorithm** based on elimination theory, we obtain:
 - $R(t, c) \bmod p = t^3 + 15794$,
 - $R(c, z_0) \bmod p = z_0^3 + 18182z_0 + 1319$.
- Set $b_t = 3$, $b_{z_0} = 3$,
- Compute $F(t, 0) = 1 + t^3 + 3t^6 + 12t^9 + 55t^{12} + 273t^{15} + 1428t^{18} + O(t^{2 \cdot b_t \cdot b_{z_0} + 1})$
- Guess $A := t^3 z_0^3 - z_0 + 1$ such that $A(t, F(t, 0)) = O(t^{(b_t+1) \cdot (b_{z_0}+1) - 1})$,
- Check that $A(t, F(t, 0)) = O(t^{2 \cdot b_t \cdot b_{z_0} + 1})$

The output A is certified.
